A NEW BREEDING SITE OF THE MALEO IN CENTRAL SULAWESI

by

Hiroshi Kobayashi & Kunkun Jaka Gurmaya

A previously unreported breeding site of the Maleo *Macrocephalon maleo* was discovered in Central Sulawesi on 31 August 1990. The site is located on Libun beach (0°38'S, 123°23'E), at the tip of the Balantak Peninsula (Luwuk regency). About ten birds and twelve nest diggings were observed on the white sand beach, close to a small forest remnant.

The site lies about 500 m from the nearest house of Ubun village, and has been partly destroyed. The eggs are collected by local people, one informant claiming to have been collecting at the site every year since during the 1940s. We considered the site to be severely threatened.

This is an additional site to those listed in Dekker (1990), Baltzer (1990), Kukila (1990), Pramono (1991) and Dekker & Argeloo (1992).

Acknowledgements

We are very grateful to A. Priyono, Faculty of Forestry, Bogor Agricultural University, for assistance as a field coordinator, and to the staff of P.T. Ifdeco Wana Bangun in Jakarta, in particular to Bans Suranggajiwa, director of the company, for giving us an opportunity to survey. We are also grateful for comments on the first draft received from R.WJU. Dekker and D.A. Holmes, and to JICA Indonesia office for financial assistance, and we thank the staff of PHPA in Central Sulawesi for their assistance in our field work.
